Fedor Berman

Senior Backend Engineer · Go · Distributed Systems · Fintech & Crypto

// Belgrade, Serbia // +381 65 319 6974 // fyodorberman@gmail.com // linkedin.com/in/fyodor-berman
// t.me/TeoBy // fberman.me

\$ cat summary.md

Senior Backend Engineer with 5+ years of experience designing and shipping fintech, crypto, and high-load distributed systems in Go. Launched Visa card issuing through a Banking-as-a-Service (BaaS) integration, a Bitcoin decentralized exchange (DEX) integration, and fiat on/off-ramps at a crypto wallet startup. Contributed to a mail service sustaining 10,000+ requests per second (RPS) at VK; optimized billion-row ClickHouse analytics. End-to-end ownership: API and schema design, load testing, infrastructure as code, production on-call.

Backend Engineer @ Alien

May 2026 – present · remote

Crypto wallet & digital identity app: self-custodial wallet, payments, Visa cards, encrypted messaging. Shipping across 8 Go microservices

- ▶ **Launched Visa cards** in the app by integrating the Wirex Banking-as-a-Service (BaaS) platform: built a Go microservice issuing user-scoped auth tokens, mirroring card state, and turning webhooks + polling into a real-time transaction feed with push notifications — live across 3 environments
- ▶ **Enabled in-app Bitcoin trading** via the Flashnet decentralized exchange (DEX) on Spark: quote/estimate flow, webhook pipeline, and buy-and-bridge market transactions
- ▶ **Scaled contact-to-profile matching to 50M contacts** by rebuilding the pipeline: batch migrators, phone-number normalization, partial indexes; cut profile search latency with redesigned PostgreSQL full-text-search indexes, validated by purpose-built load tests
- ▶ **Built a contest & leaderboard platform from scratch** — seasons, invite reconciliation, winner lottery, on-chain payouts, event-driven push notifications — deployed to AWS in under 3 weeks
- ▶ **Reduced payment-fraud surface** by hardening fiat on/off-ramp webhook verification (constant-time signature comparison) across providers, including MoonPay
- ▶ Shipped encrypted-message caching for XMTP chat; extended the push service with iOS Live Activities

> tech: go, postgresql, redis/valkey, aws, terraform, grpc, rest, solana, bitcoin/spark, xmtp

Backend Engineer @ RedTrack.io

Nov 2025 – May 2026 · remote

Ad-tracking and marketing analytics platform (SaaS)

- ▶ **Eliminated a billion-row ClickHouse JOIN** in cohort reports by pre-computing the NCPA (net cost per action) metric via ScyllaDB lookups; changes spanned 4 services, with a backfill worker for ~820K customers (batching, fingerprint deduplication). Prototyped and benchmarked a ClickHouse→StarRocks migration on production data
- ▶ **Designed OAuth 2.0 authentication from scratch** (redirect flow, token exchange, refresh tokens); integrated Stripe Payment Links into billing; migrated password hashing SHA-1→bcrypt with transparent re-hash on login — zero downtime
- ▶ Built ad-network API integrations for cost import and conversion export with deduplication, rate-limit handling and retries; event-driven NSQ workers with batching and exponential backoff
- ▶ Contributed to the Customer Data Platform (CDP): first/last-touch attribution, cross-browser fingerprint matching, postback-token deduplication

> tech: go, clickhouse, starrocks, scylladb, mongodb, nsq, oauth 2.0, stripe

Backend Engineer @ VK Tech

Nov 2024 – Nov 2025

Infrastructure for VK Mail — the mail service of the largest Russian social network

- ▶ **Contributed to a distributed mail service sustaining 10k+ requests per second (RPS):** implemented MySQL→Tarantool replication with strong consistency, fixed sharding and routing issues in Tarantool proxies, and optimized low-level data serialization — reducing latency and improving stability
 - ▶ Designed and debugged cross-zone event-driven replication on Apache Kafka; built an artifact delivery service with S3 integration wired into the team's CI/CD pipeline
 - ▶ Migrated critical services from bare metal and on-prem Kubernetes to the cloud; authored Kubernetes and Puppet manifests; took regular on-call duty during failure drills and disaster-recovery scenarios
- > `tech: go, mysql, tarantool, apache kafka, kubernetes, puppet, s3, ci/cd`

Backend Engineer @ SimbirSoft

Oct 2023 – Nov 2024

Software development company serving enterprise clients

- ▶ Decomposed a legacy monolith into Go microservices for one of the largest mobile network operators; designed databases for the new services, ran code reviews and managed releases
 - ▶ Designed and built a microservice for a major electronics retail chain, including Yandex Pay integration and full technical documentation
- > `tech: go, postgresql, microservices, rest`

Go Developer @ ShtrafovNet

May 2023 – Oct 2023

- ▶ Split a monolith into services; designed and shipped a billing microservice, adapting it for required load and optimizing SQL queries for performance

Junior Developer @ KnopkaLab

Aug 2020 – Mar 2022

- ▶ Built a logging service in Go and an in-house Telegram Bot API library used for automating routine operations; wrote unit tests and participated in code reviews
